WHERE IT GOES

This part in colour, its neighbours in grey

HOW TO MAKE IT AND HOW IT FITS

Make twelve. Cut 720 mm of 20 x 3 mm flat bar each.

Bend on edge (the hard way) in a plywood jig cut to the curve of the dish: height above the vertex = radius squared / 2,000.

At 100, 200, 300, 400, 500, 600, 700 mm out: 5, 20, 45, 80, 125, 180, 245 mm. Clamp the bar to the jig as you go.

The top edge of the bent rib follows the curve; the rib stands 20 mm deep behind the petals.

Trim both ends square to the jig base (upright): the outer end 699.5 mm and the inner end 55 mm from the axis line.

Clip bolt holes and rivet holes are drilled at assembly, through the clips and the petal flanges.

Check: on the jig the rib touches the curve within 1 mm.

SunClave rib (make 12): making sketch
